

Implement Client Script & UI Policy (Incident)

6. Project Documentation / FSD

Platform

ServiceNow

Application Area

Incident Management

Features Used

UI Policy, UI Policy Actions, Client Scripts, Form Validation.

Configuration Summary

- High Impact Control UI Policy on Incident.
- Impact = 1 – High condition.
- Assignment group mandatory.
- Urgency read-only when condition is true.
- onChange: automatically set Urgency to 1 when Impact is 1.
- onSubmit: block High Impact save when Assigned To is empty.
- onCellEdit: block State list editing.

Operational Flow

Incident form → Impact set to High → UI Policy and onChange behavior activate → Urgency is set to High and becomes read-only → save validation requires Assigned To → Incident is saved only when required conditions are satisfied. Separately, direct State list editing is blocked while form-based State updates remain allowed.

Documentation Gaps

The source does not provide environment name, instance URL, screenshots, deployment record, named developer, dates, or formal approval/sign-off.

Source basis: supplied 18-page Project 3 PDF. Unsupported project metadata, screenshots, execution results, and dates are not fabricated.
