

# Implement Client Script & UI Policy (Incident)

## 7. Final Report

### Introduction

This micro project demonstrates how ServiceNow UI Policies and Client Scripts can enforce dynamic field behavior, automate updates, and prevent incorrect Incident submissions.

### Objective

The objective is to enforce data integrity on Incident records through client-side controls that dynamically make fields mandatory, auto-populate values, control field behavior, and prevent submission when required conditions are not met.

### Implementation Summary

- High Impact Control UI Policy is applied to Incident when Impact is 1 – High.
- Assignment group is made mandatory and the policy reverses when the condition is false.
- Urgency becomes read-only under the high-impact condition.
- An onChange Client Script automatically sets Urgency to High for high-impact incidents.
- An onSubmit Client Script prevents saving when Assigned To is missing for a high-impact incident.
- An onCellEdit Client Script prevents State changes directly from list editing.

### Validation Summary

The documented tests cover mandatory enforcement, successful save, reverse condition behavior, list-edit blocking, and form-based State updates.

### Conclusion

The supplied project concludes that combining UI Policies with onChange, onSubmit, and onCellEdit Client Scripts provides a lightweight way to enforce mandatory fields, control user interactions, automate urgency updates, and maintain consistent Incident data.

### Source Conclusion

The source describes the solution as lightweight, efficient, and suitable for short-duration micro projects while demonstrating practical ServiceNow form-usability and data-integrity controls.

Source basis: supplied 18-page Project 3 PDF. Unsupported project metadata, screenshots, execution results, and dates are not fabricated.
